

# Geese

- When geese fly in a V formation they can fly up to 70% further than flying solo. The birds at the back use the air currents from those in front to help them, and every so often they change places, so the geese in front can rest. Those at the back honk loudly to encourage the others to keep going.
- Who are you flying with? Who supports you when you need encouragement or need to save energy?
- Who needs your encouragement and support to keep going?
- How are you keeping the communication channels open to make sure you're all flying in the same direction?

***'You fly further together. That's the bottom line. Geese wouldn't be able to migrate to the sun without all flying together.'*** Emma Hayes
